

Tuesday 2nd June

Today we are going to learn about Camouflage

Find out how a minibeast's appearance can help it avoid being eaten.

Note: Ladybirds, wasps and hornets have bright colours to warn other creatures that they might be dangerous. Ladybirds don't look harmful, but they secrete a yellow liquid that is toxic to some creatures. Minibeasts such as hoverflies and horntails have evolved to mimic these warning colours, but they are not dangerous. Other mimics include butterflies. Rotate an image of the peacock butterfly 180 degrees and it looks like an owl.

Read through the camouflage pack provided for more information

Minibeast art

Have you decided what mini beast you are going to make and what you are going to use? Today we would like you to continue making your minibeast out of junk and don't forget to send us a photo.

Remember to always ask permission before you use anything.
